

PDL[®]

PROFI DRY LUBE

PROFI DRY LUBE

PDL®, the unique dry chain protection, was developed to maintain modern seal ring chains (O-X-Z-Quad ring). The one-of-a-kind function of PDL® is the result of several years of research and thousands of test kilometers. Riders all over the world rely on PDL®, in the sands of the Namibian desert, with top speed on the German autobahn or on their daily ride to work.

Since 1995 PDL® proves its qualities under all operating conditions! Owing to the special mode of functioning, in particular the lack of grease, PDL® extends the life of your chain kit and guarantees a clean rear wheel at all times.

Mode of operation:

PDL® seals the metal surface. The outer chain rollers slide easily, clean and with an extremely reduced friction over the micro-PTFE-seal. Since PDL® does not bind any dirt, the “abrasive effect” of a chain lubricated with grease does not appear. Mechanical wear of the parts is reduced to a minimum and chain kits last longer.

Special features:

Since PDL® can not be spun off, one can replaces approx. 2-3 cans of conventional chain lube.

Further applications:

PDL® is used for many different applications: Mountain bikers and riders of recumbents know it as their perfect lubricant.

PDL® also proves its qualities among industrial users and machine builders.
