

Dear customer, dear distribution Partner,

Our tools are designed for a very long usability. To avoid possible errors when changing the 3 AG5 button cells here is our additional note:

**Please double check the correct installation direction (see manual / pictures / tool grip sticker).
Unfortunately some customer do not used the battery-pack tube again after chancing the batteries.
(It is important to use the isolation sleeve.)**

Used button cells sometimes get thicker after use. Slit the insulation and then put in 3 new batteries.

Troubleshooting

If you maybe don't have the plastic tube any more, please us a simple piece of paper (24 mm x 14mm) and create a new roll into the battery metal screw. Now the button cells are isolated again.

**If the insulating sleeve needs to be replaced or has been discarded:
A simple piece of paper or thin foil can do the same function!**

24 mm X 14 mm

**The device itself cannot be defective if the usual handling
of measuring devices is observed.**

- The integrated laser is good for ~ 10,000 hours.
- Components cannot become defective if handled with care.
- Fault sources such as switches or solder joints are not present.
- The laser unit is vibration resistant.

Mit freundlichen Grüßen
Best Regards
